

1. I'm not able to register new users using "Register now", could you please enable this.

- I have checked the system , the register works fine. I registered one user and logged in with it. Yes make sure during registration you put unique user id and strong password,

5. When one user is already logged in and I can still login with another user in another tab of chrome browser, can we make it one user at a time?

- This should not happen. I have checked it. At once only one user can login in the browser. For example if an abc user is logged in the admin login will disappear from the browser and the admin must login again . To observe this you must refresh.

The screenshot shows the Django administration interface for user management. The sidebar on the left contains links for 'Groups', 'Dns', and 'Users'. The main content area is titled 'Select user to change' and displays a table of users. The user 'mustahid1999' is highlighted with a red box. The table has columns for 'USERNAME', 'EMAIL ADDRESS', 'FIRST NAME', 'LAST NAME', 'STAFF STATUS', and 'ACTIVE'. The user 'mustahid1999' is listed with a red status icon and is active. The user 'admin' is also listed with a green status icon and is active. The interface includes a search bar, a filter sidebar on the right, and a '2 users' count at the bottom of the table.

USERNAME	EMAIL ADDRESS	FIRST NAME	LAST NAME	STAFF STATUS	ACTIVE
admin	admin@gmail.com			✓	✓
mustahid1999				✗	✓

Test Cases for Login Redirection

Test Case 1: Login Redirection with 'next' Parameter

Objective:

Verify that a user is redirected to the intended page specified in the **next** parameter after a successful login.

Preconditions:

- The user is not logged in.
- The application has protected pages that require authentication.

Steps:

1. Navigate to a protected page (e.g., **/dashboard/**) without logging in.
2. Verify that the application redirects to the login page with a **next** parameter (e.g., **/?next=/dashboard/**).
3. Enter valid login credentials on the login page.
4. Submit the login form.
5. Verify that the user is redirected to the URL specified in the **next** parameter (e.g., **/dashboard/**).

Expected Result:

- The application appends the **next** parameter to the login page URL.
- After logging in, the user is redirected to the specified URL.

Test Case 2: Login Redirection to Default Page

Objective:

Verify that a user is redirected to the default page (e.g., **/dashboard/**) after a successful login when no **next** parameter is specified.

Preconditions:

- The user is not logged in.

Steps:

1. Navigate directly to the login page (**/**).
2. Enter valid login credentials.

3. Submit the login form.
4. Verify that the user is redirected to the default page (e.g., [/dashboard/](#)).

Expected Result:

- After a successful login, the user is redirected to the default page.

Test Case 3: Invalid Credentials on Login Page

Objective:

Verify that invalid login credentials prevent the user from logging in and show an appropriate error message.

Preconditions:

- The user is not logged in.

Steps:

1. Navigate to the login page ([/](#)).
2. Enter invalid login credentials.
3. Submit the login form.
4. Verify that the user is not redirected and remains on the login page.
5. Verify that an error message is displayed (e.g., "Invalid username or password").

Expected Result:

- The user is not redirected.
- An appropriate error message is displayed.

Test Case 4: Access Protected Page Without Login

Objective:

Verify that accessing a protected page without logging in redirects the user to the login page.

Preconditions:

- The user is not logged in.
- The application has protected pages that require authentication.

Steps:

1. Navigate to a protected page (e.g., [/dashboard/](#)) without logging in.

2. Verify that the application redirects to the login page with the `next` parameter (e.g., `/?next=/dashboard/`).

Expected Result:

- The user is redirected to the login page with the `next` parameter.

Test Case 5: Logout and Login Again**Objective:**

Verify that after logging out, a user is required to log in again when accessing a protected page.

Preconditions:

- The user is logged in.

Steps:

1. Log out of the application.
2. Attempt to access a protected page (e.g., `/dashboard/`).
3. Verify that the application redirects to the login page.
4. Log in again with valid credentials.
5. Verify that the user is redirected to the intended page after logging in.

Expected Result:

- The user is redirected to the login page after logging out.
- After logging in again, the user is redirected to the intended page.

General Notes

- Ensure the `next` parameter is securely implemented to prevent open redirection attacks.
- Test cases should be repeated for various user roles (e.g., admin, regular user) if applicable.
- Use valid and invalid credentials to test different scenarios thoroughly.
